

Our environmental strategy

Sustainability and **environmental protection** are an integral part of the **GLS logistics strategy**.

In April 2021 we presented the ambitious **ClimateProtect project**, with the long-term goal of **carbon neutrality by 2045/50**. We will reach this goal through the progressive development of activities with some intermediate steps: a first phase with the **offsetting of CO₂ well-to-wheel emissions** and the **achievement of the EN 16258 certificate** by 31 March 2022. In the second and third phases, we will aim for an **increasing reduction in CO₂ emissions**.

We are focusing on a **wide range of measures** to

achieve our targets.

At GLS, **94% of the impact**, or more correctly the **ecofootprint**, is transport. This is why in the future we will be asking our suppliers to invest in **alternative drive vehicles** (10% of their fleet minimum). We will also implement investments including the **redesign of our facilities** with the installation of solar panels and relamping projects with LED technology in our current locations.
